

### **Inclusion of Individuals Across Lifespan**

Children (individuals under the age of 18) will be excluded from this study. This study focuses on the adult visuo-locomotor system because of empirical and scientific complexities that would arise from studying an undeveloped adolescent or younger visuo-locomotor system. The development of visuo-locomotor behavior in children is a worthy topic of research, but goes outside of the scope of the proposed studies. The researchers in the Matthis Lab and at Northeastern have extensive experience conducting research with humans of all ages.
